Step 1: Download and Install Talend

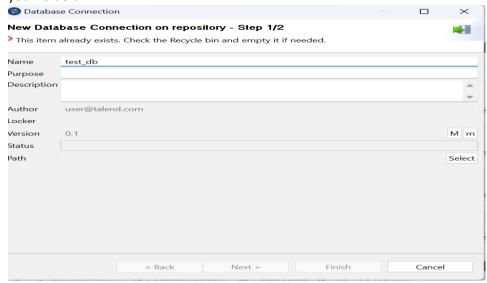

- 1) Talend is downloaded from the official URL
- 2) Once the Talend is installed, we get jvm error and to resolve the issue, either change the configuration file or download the new java version.
- 3) The new java version is downloaded from official java website and set up JAVA_HOME variable and path variables from environment variables and now lets deep dive into Talend Data Integration.

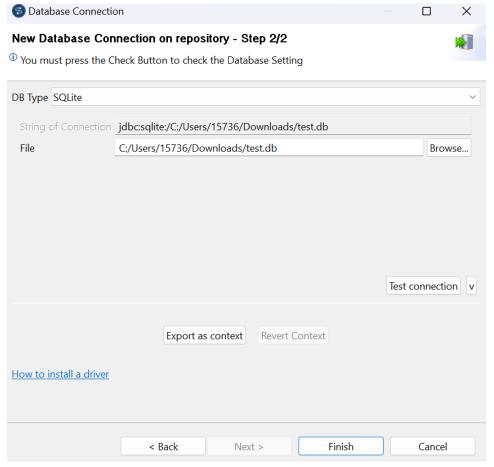

Step 2: Talend set up database connections and import the database.

- 1) Open Talend
- 2) Go to Database connections option and right-click on Database connections and select Create Connection option.

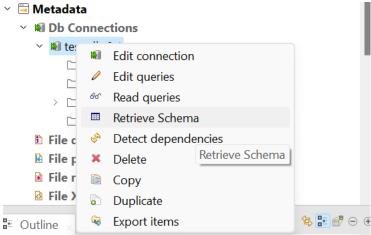

3) Now Give the Name for a connection and select SQLDatabase and import the database file from your folders.

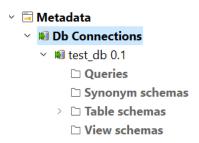

- 4) Check for connection weather if it is successful.
- 5) Retrieve tables by right clicking on test_db 0.1 and select retrieve schema.

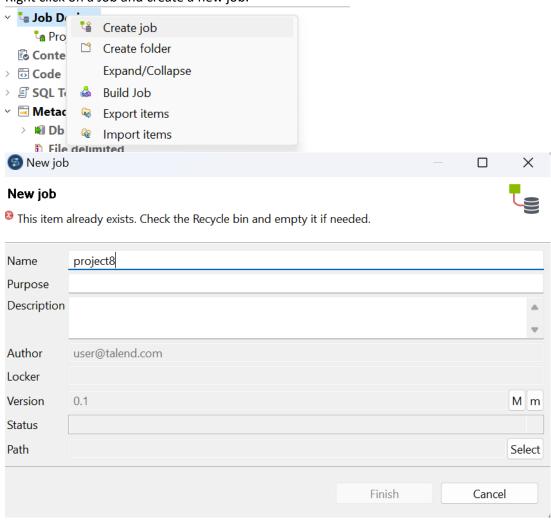

- 6) You can see tables in Table Schemas
 - ∨ □ Table schemas
 - > **III** DIM_GEOGRAPHY
 - > **III** DIM_PRODUCTS
 - > DIM_TIME
 - > **III FACT_SALES**

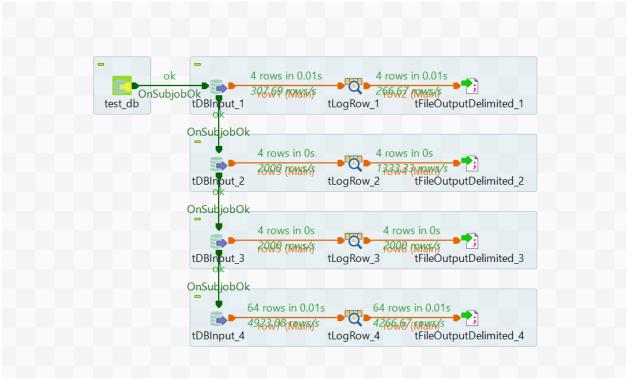

Step 3: Create a Job in Talend

1) Right click on a Job and create a new job.

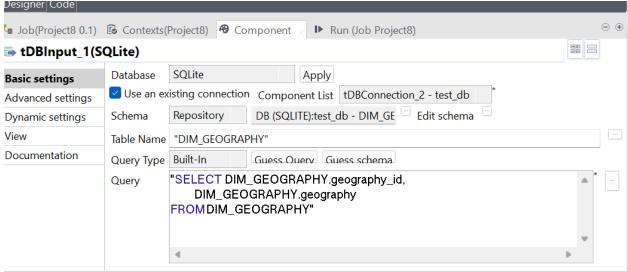

2) After creating job, you can start working on it.

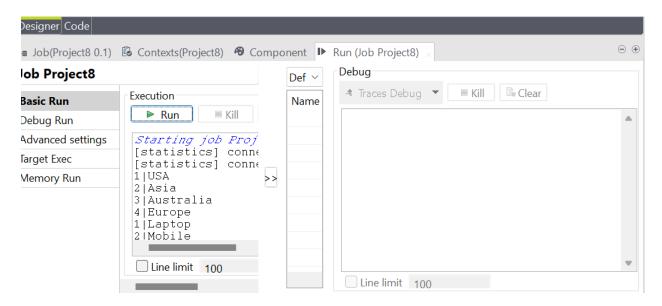

Step 4: Start Working on the Assignment Now

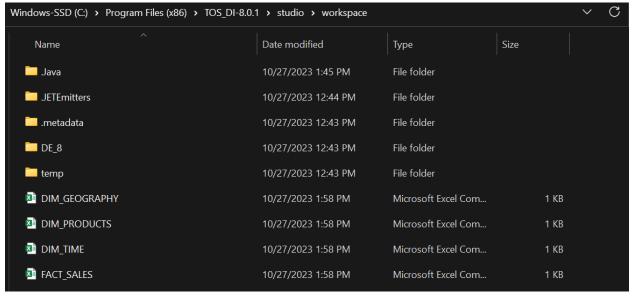

- 1) Drag and Drop test_db and right click and select trigger and then select on Subjob Ok
- 2) Now drag and drop each table where you see tDBINput icons and go to Components and change the settings as follows:

- 3) Do the above for 4 tables.
- 4) While doing it, click Guess Query to get the automatically query.
- 5) Connect tDBINputs to tLogRow and to tFileOutputDelimitted.
- 6) Select tFileOutputDelimitted and go to components and change the output file names, delimiter and say Run Job in Run section.

Step 5: Check for downloaded files.

Step 6: Get html Job documentation.

1) Right click on job. Select Generate Doc as HTML.
